

# Week 3

- This week would apply RNNs into the time series neural network

RNN Diagram

- A difference compared to last week is that RNN inputs are 3 dimensional

```
shape=[batch_size, time_steps, dims]
```

- Sequence to vector RNNs ignores all the outputs except the last one (Default in Keras)
- Has to add `return_sequence=True` to add another layer

## Lambda Layer

- Lambda layer allows arbitrary operations to effectively expand the functionality of Keras
- Example:

```
model = keras.models.Sequential([  
    keras.layers.Lambda(lambda x: tf.expand_dims(x, axis=-1),  
        input_shape=[None]),  
    keras.layers.SimpleRNN(20, return_sequences=True),  
    keras.layers.SimpleRNN(20),  
    keras.layers.Dense(1),  
    keras.layers.Lambda(lambda x: x * 100.0)  
])
```

## Using RNN and Lambda to Create Neural Network

- The code below uses the techniques from above to create a neural network

## LSTM

- A better approach may be using LSTMs instead of RNNs to see the impact since there was a flat area while using RNNs
- LSTMs has cell states that passes through each cell so more information could be maintained
- Earlier data can have a better impact

LSTM Cells

- Code for neural network using LSTM cells

[https://s3-us-west-2.amazonaws.com/secure.notion-static.com/1972d2be-213b-4731-a2d8-c5576537b4c4/lstm\\_neural\\_network.py](https://s3-us-west-2.amazonaws.com/secure.notion-static.com/1972d2be-213b-4731-a2d8-c5576537b4c4/lstm_neural_network.py)
